Part of the BRCAl-sasociated genome surveillance complex (BASC), which contains BRCAl, MSH2, MSH6, MLH1, ATM, BLM, PMS2 and the RADSO-MREII-NBS1 protein complex. This association could be a dynamic process Subcetiullar incomplex contains subcetiullar incomplex. The cell cycle and within subnuclear domains. ALTERNATIVE PRODUCTS:
       and sporadic
"Involvement of hMSH6 in the development of hereditary and sporadic colorectal cancer revealed by immunostaining is based on germline mutations, but rarely on somatic inactivation.";

Int. J. Cancer 97:643-648 (2002).

-I-FUMCITOR. Restores repair of base-base and single- nucleotide insertion-deletion mismatches, and increases the proficiency to process heteroduplexes with two-, three-, or four- nucleotide insertion-deletion mismatches. GTBP binds covalently to G/T

Donohue P.J., Feng S.L.Y., Alberts G.F., Guo Y., Peifley K.A.,

Bun D.K.W., Winkles J.A.;

Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases.

-!-FUNCTION: Restores repair of base-base and single- nucleotide

insertion-deletion mismatches, and increases the proficiency to

process heteroduplexes with two., three-, or four- nucleotide

process heteroduplexes with two., three-, or four- nucleotide

insertion-deletion mismatches. GTBP binds covalently to G/T
                                                                                       (G/T)

"Intergeneric transfer and recombination of the 6-phosphogluconate dehydrogenase gene (gnd) in enteric bacteria.";
Proc. Natl. Acad. Sci. U.S.A. 91:10227-10231(1994).
-!- CATALYTIC ACTIVITY: 6-phospho-D-gluconate + NADP(+) = D-ribulos
5-phosphate + CO(2) + NADPH.
                                                                                                                                                                                                                                                                                                                                                                       -1- PATHWAY: Hexose monophosphate shunt.
-1- SIMILARITY: Belongs to the 6-phosphogluconate dehydrogenase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ch 4.8%; Score 137; DB 1; Length 468;

Submitted (JUN-2002) to the EMBL/GenBank/DDBJ databases.
-! FUNCTION: Potential histone methyltransferase. Histone methylation
gives specific tags for epigenetic transcriptional activation or
repression (By similarity).
-! SUBCELLULAR LOCATION: Nuclear (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- SIMILARITY: Contains 3 PHD-type zinc fingers.

The invention relates to human enzyme (ENZM) polypeptides and their corresponding polynucleotides. ENZM sequences are useful for preparing a composition for diagnosing or treating a disease or condition associated with decreased expression or overexpression of functional ENZM. The disorders include immune disorders (anaemia, allergy or asthma), infectious disorders (viral, fungal, parasitic or protozoal infection), immune deficiencies (acquired immune deficiency syndrome; ALDS), metabolic disorder (Addison's disease, diabetes or goiter), reproductive (disorders (Infertility or impotence), cardiovascular disorders (atherosclerosis or myocardial infarction), eye disorders and cell proliferative disorders (cancer). ENZM DNA is useful in gene therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human enzyme (ENZM) polypeptide, useful for preparing a composition for treating a disease associated with decreased expression or

The invention comprises the amino acid and coding sequences of human nucleic acid-associated proteins (NAAR). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of NAAP, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis or cancer); developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation); neurological disorders (e.g. Albibeimer's disease, Parkinson's disease or epilepsy); and autoimmune/inflammatory disorders (e.g. Albs), allergies, asthma or Crohn's disease). The DNA sequences of the invention are useful for creating transgenic animals to model human disease. The present amino acid sequence represents a human nucleic acid-

Human cDNA clones represented in AAF98374 - AAF98489 encode secreted proteins AAB90667 - AAB90750. The cDNA clones are isolated from various classue types, and may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate protein expression. The collypeptides and nucleic acids may be used as nutrients or to modulate cyclokine and cell proliferation/differentiation activity and may also be involved in modulation of the immune system. The cDNA sequences, proteins, their agonists and/or antagonists exhibit haematopoiesis regulating activity; tissue growth activity; activin/inhibin activity; cfemokinetic activity; haematopoiesis chemoteactic/chemokinetic activity; haematopoiesis activity; cadherin/tumour suppressor activity; and/or tumour inhibition activity. Included in the invention are probes represented in AAP98490
                                                                              Human; secreted protein; nutrient; cytokine modulator; proliferation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is secreted protein, encoded by a polymucleotide of the invention. The DNA was isolated from a human adult ovary CDNA library, and is designated clone AQ73 3. The DNA sequences and encoded polypeptides can be used as mutritional sources or supplements, or may immune stimulating or suppressing activity, haematopoiesis regulating activity, receptor/ligand activity, anti-inflammatory activity, activity, continuating or suppressor activity, inclinian activity, cadherin/inhibin activity, chemostatic/chemokinetic activity, cadherin/tumour invasion suppressor activity, tissue growth activity, tumour inhibition activity or other activities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated polynucleotides - obtained from human adult testis, human adult ovary, human adult brain and human adult heart cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               25-SEP-2000;
       The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and cDNA (AAS34767-AAS35050) and DNA cases associated polypeptides, and cDNA (AAS34767-AAS35050) and DNA cases associated polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of disorders (e.g. leukaemia, bone cancer, bladder cancer, brain stem glioma, adult liver cancer, childhood cerebellar astrocytoma, or Hodgkin's lymphoma). The sequences of the invention may also be useful for treating other disorders, reproductive disorders, gastrochinestinal disorders, pulmonary disorders, reproductive disorders, gastrochinestinal disorders. The polymucleotide sequences of the invention are also useful in gene therapy. AAUSIS68-AAUSI851 represent the novel human neoplastic disease associated polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was for in interior.
                                                                                                                           Novel polypeptides and polynuclectides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, and for treating cancers, rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neoplastic disease-associated polypeptide; gene therapy; hyperproliferative disease; cancer; autoimmune disorder; diabetes; rheumatoid arthritis; systemic lupus erythematosus; multiple sclerosis; autoimmune thyroiditis; haemolytic anaemia; haematopoietic disorder; haematologic disorder; anaemia; thrombocytopaenia; allergic reaction; sathma; eczema; inflammatory disorder; ischaemia-reperfusion injury; inflammatory bowel disease; Crohn's disease; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; renal disorder; acute glomerulonephritis; end-stage renal disease; cardiovascular disorder; atherosclerosis; myocarditis; infectious disease; AlDS; cachexia; morexia; wound healing; epithelial cell proliferation; Human.

The invention relates to one of 238 disclosed human neoplastic disease—
associated polypeptides encoded by 171 disclosed cDNA sequences
(including their domains, epitopes, full-length proteins,allelic variants
or species homologues). Also included are there encoding nucleic acids, a
crecombinant vector comprising the nucleic acid, a recombinant host cell
comprising the nucleic acid (expressing the protein), an isolated
comprising the nucleic acid (expressing the protein), an isolated
condition or ameliorating a medical condition, diagnosing a pathological
creating or ameliorating a medical condition, diagnosing a pathological
condition or a susceptibility to a pathological condition in a subject,
condition or a susceptibility to a pathological condition in a subject,
condition or a bolding partner to the polypeptide, identifying an activity
in a biological assay, and the gene corresponding to the cDNA sequence.
Creating, preventing, diagnosing, prognosticating, treating or
detecting, preventing, diagnosing, prognosticating, treating or
ameliorating medical conditions such as hyperproliferative diseases or
cancer, autoimmune disorders (e.g. diabetes, rheumatoid arthritis,
cancer, autoimmune disorders (e.g. diabetes, rheumatoid arthritis,
contained anneania) haematopoietic or haematologic disorders (e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ·.
        New isolated human neoplastic disease-associated polypeptides and polymucleotides, useful for diagnosing, preventing, prognosticating or treating medical conditions such as cancer, AIDS, diabetes or Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anaemia or thrombocytopaenia), allergic reactions including asthma or eczema, inflammatory disorders (e.g. ischaemia-reperfusion injury,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Drosophila, developmental biology; cell signalling, insecticide;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGI76-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly

Single nucleotide polymorphism sites in barley varieties and DNA sequences containing them for analysis and identification of barley varieties and production of barley transformants with desired characteristics

Disclosure; SEQ ID XX; 284pp; Japanese.

barley (Hordeum vulgare) which contain single nucleotide polymorphisms (SNP). The oligonuclectides may be used for analysis of SNRs among barley varieties, identification of particular varieties and genotype-phenotype analysis, isolation of specific genes and creation of new varieties by transformation of barley varieties with them and production of new barley varieties with desired properties. The present sequence represents an oligonucleotide clone sequence featured in the specification. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published-pct-sequences The present invention relates to oligonuclectide clones originating in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a plant gamma-hydroxy butyrate dehydrogenase (GHBDH). The specification also describes a plant gamma-minobutyric acid (GABA) transaminase (GABA-T). The proteins are involved in the metabolism of GABA in plants. GABA-T is used to transaminate GABA to form succinic semialdehyde, which may be converted to gamma hydroxybutyrate by GHBDH. The polynucleotides are used to produce GABA-T and GHBDH recombinantly. The proteins are useful for screening and isolation of homologous genes from other organisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel proteins related to gamma aminobutyric acid (GABA) metabolism, GABA-transaminase and gamma hydroxy butyrate dehydrogenase useful for screening and isolation of homologous genes from other organisms.
                                                                                                                                                                                                                                         Location/Qualifiers

Novel isolated nucleic acid fragment encoding a tuliposide A synthesizing protein, useful for creating recombinant organisms that have the ability to synthesize tulipalin A, tuliposide A or tuliposide A pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to genes encoding key enzymes in the biosynthesis of alpha-methylene-gamma-butyrolactone (tulipalin A). Key enzymes include glutamate decarboxylase, gamma-aminobutyrate aminotransferase, gamma-hydroxybutyrate dehydrocopiase and UDP-glucosyltransferase. The invention is useful for producing tulipalin A or tuliposide A or its pathway intermediates such as alpha-methylenesuccinate semialdehyde, alpha-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    methylene-gamma-aminobutyrate or alpha-methylene-gamma-hydroxybutyrate. Tulipalin A sequences are used to immunise animals to produce polyclonal or monoclonal antibodies with specificity for them or as targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides. The present sequence is mouse-ear cress (Arabidopsis thaliana) gamma-hydroxybutyrate dehydrogenase homologue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Branched chain amino acid degradation enzyme; HMG-CoA lyase;
3-hydroxyisobutyrate dehydrogenase; 3-hydroxymethylglutaryl CoA;
isovaleryl-CoA dehydrogenase; transgenic plant; soybean; EC 1.1.131.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

                                                                                                                                                                      18-MAY-1
                                                                                                                                                                                                                                                                            04-JUN-
                                                                                                                                                                                  19-MAY-
  ô
                                                                                                                                                                                                  The invention relates to nucleic acid fragments encoding branched chain amino acid degradation enzymes. Particularly the invention relates to 3-hydroxyisobutyrate dehydrogenase, 3 hydroxymethylgultaryl CoA (HMG-CoA) lyase and isovaleryl-CoA dehydrogenase polypeptides and polymucleotides derived from corn, rice and wheat. Sequences of the invention are used to produce transgenic plants having an altered expression of the enzyme. Polymucleotides of the invention can be used as probes for physical mapping of genomes. The present sequence is soybean 3-hydroxyisobutyrate dehydrogenase (EC 1.1.1.31) from ses2w.pk0002.e5 clone
                                                                                                                                                   Isolated polynucleotide encoding 3-hydroxyisobutyrate dehydrogenase, used to produce transgenic plants having an altered expression of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

The invention relates to nucleic acid fragments encoding branched chain amino acid degradation enzymes. Particularly the invention relates to 3-hydroxyisobutyrate dehydrogenase, 3-hydroxymethylgiutaryl CoA (HWG-CoA) lyase and isovaleryl-CoA dehydrogenase polypeptides and polynucleotides derived from corn, rice and wheat. Sequences of the invention are used to produce transgenic plants having an altered expression of the enzyme. Polynucleotides of the invention can be used as probes for physical mapping of ganomes. The present sequence is corn 3-hydroxyisobutyrate dehydrogenase (EC 1.1.1.31) from crln.pk0191.bl0, p0076.cwhan08r and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated polynucleotide encoding 3-hydroxyisobutyrate dehydrogenase, used to produce transgenic plants having an altered expression of the enzyme.
           or monoclonal antibodies with specificity for them or as targets to facilitate design and/or identification of inhibitors of those enzymes that may be useful as herbicides. The present sequence is Tulip pistil gamma-hydroxybutyrate dehydrogenase homologue
                                                                                                                                                                                                                                                                                                                                                                Branched chain amino acid degradation enzyme; HMG-CoA lyase;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to genes encoding key enzymes in the biosynthesis of alpha-methylene-gamma-butyrolactone (tulipalin A). Key enzymes include glutamate decarboxylase, gamma-aminobutyrate aminotransferase, gamma-hydroxybutyrate dehydrogenase and UDP-glucosyltransferase. The invention is useful for producing tulipalin A or tuliposide A or its pathway intermediates such as alpha-methylenesuccinate semialdehyde, alphamethylene-gamma-hydroxybutyrate. Tulipalin A sequences are used to immunise animals to produce polyclonal

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression the 6213 antisense sequences given in the specification where expression of the 6213 antisense send inhibited by the antisense encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an bost cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that the san activity adainst a biological pathway the gene product or that has an activity against a biological pathway or equived for proliferation, or that inhibits cellular proliferation; (8) required for proliferation, or that inhibits cellular proliferation of an ora gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene compound; a continuing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the strains or product is overexpressed or underexpressed; (12) determining the extent of the strains or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids activity, required for proliferation in cells other than S. aureus, S. typhimurium, required for proliferation in cells other than S. aureus, S. typhimurium, continuity in the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained to patent didentify from part of the printed specification, or patent did not form part of the prolifera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                       Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zyskind JW;

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: of the nucleic acid inhibits proliferation of a cell. Also included are: coding a polypeptide whose expression is inhibited by the antisense encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding contisense nucleic acid; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in which the test compound that inhibits proliferation; (8) identifying a gene required for cellular proliferation or the biological contains a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the est compound that inhibits proliferation of an organism acts; (12) determining the extent product is overexpressed or underexpressed; (12) determining the extent product each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumanni and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  baumannii; bacterial disease; antibacterial; vaccine;

```
The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid of the nucleic acid antisense product operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway to proliferation, or that inhibits cellular proliferation of the pathway in which a proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or underexpressed; (12) determining the extent or compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the strains; or (13) identifying the target of a compound that inhibits for confleration of an organism. The antisense nucleic acids required for strains; or for screening for homologous nucleic acids required for glullar proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                           Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Zyskind JW;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial Avacines, as targets for antibacterial furgs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Also included are:

(i) a weetor comprising a promoter operably linked to the nucleic acid inhibited by the antisense encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated are:

(i) a vector comprising a promoter operably linked to the nucleic acid; (4) an antibody apable of specifically binding attributed by the molypeptide or its fragment whose expression is inhibited by the attributed of a proliferation or the activity of agene in an operon required for proliferation or the activity of agene in an operon required for proliferation or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in which the test compound that inhibits proliferation of an or that inhibits proliferation of an or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of strains; or (13) identifying the expensent in a culture or collection of an organism. The anisense nucleic acids are useful for the strains or activity of hownloaders are as the propertion of an organism. The anisense nucleic acids are useful for the strains or active are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational derug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention relates to an isolated nucleic acid comprising any one of
                                                                                                  Antisense; prokaryotic essential gene; cell proliferation; drug design.

Enterococcus facetium encoding an Enterococcus facetium polypeptide

Enterococcus facetium encoding an Enterococcus facetium polypeptide

Co one of 10 fully defined sequences given in the (or comprising 40

Co complement or sequences hybridising to it). Also included are a

Co complement or sequences hybridising to it). Also included are a

crecombinant vector comprising the nucleic acid operably linked to

transcription regulatory element, a cell comprising the vector and a

crecombinant vector comprising the nucleic acid. The nucleic acids are

crecombined probe comprising the nucleic acid. The nucleic acids are

cresulting from E. facetium bacterial infection (e.g. urinary tract

resulting from E. facetium to recept in the crion of conditions

cresulting from E. facetium bacterial infection of e.g. urinary tract

infection, bacteraemia, endocarditis, wounds and abdominal-pelvic

infection, and for screening drugs such as agonists and antagonists. The

concleic acid is useful for recombinant production of Candida albicans

derived peptides or antisense polypeptides. Pharmaccutical compositions

and vaccines containing the nucleic acid are useful for preventing or

treating Enterococcus facetium infections. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
The invention relates to an isolated nucleic acid derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 299;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Indels
